

1	Outcome observed Endpoint information Y_i arrives from the trial sites; the assignment T_i stays sealed in the randomization system.	<i>trial sites</i> <i>monitoring system</i>
2	Wager recorded λ_i is computed from Y_i and the history $\mathcal{F}_{i-1}$, then recorded before the assignment is revealed.	<i>monitoring system</i>
3	Assignment revealed T_i is then released, solely to the independent unblinded monitoring system.	<i>monitoring system only</i>
4	Wealth updated $W_i = W_{i-1} \times \lambda_i / p_i$ if $T_i = 1$, else $\times (1 - \lambda_i) / (1 - p_i)$; compared with the threshold.	<i>monitoring system</i>
